

ONLINE ENTRUSTING SYSTEM

ABSTRACT OF THE INVENTION

The present invention provides an online entrusting system comprising a processing
5 controller, a database, a plurality of analyzing modules and a replying means. The
processing controller receives and processes a requiring information on an order inputted
by a user. The requiring information relates to integrated circuit packages. The database
records the requiring information and a schedule information for processing the order. The
analyzing modules produce an analysis result about analyzing if the requiring information
10 on the order is attained or not. The replying means responds the analysis result about the
requiring information to the user.
